Arefulous secretion pathway protein D [imported] - Yersinia pestis (strain CO92)
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Yersinia pestis
Gispecies: Onev-2001
Gispecies: Ascorbin Annia Millingworth, T.; Cronin, A.; Davies, R.M.; Davies, P.; Dougan, Gil, M.; Rutherford, K.; Simmonds, M.; Skelton, J.; Stevens, R.; Mnitchead, S.; Barrel
Arthite: Genomes sequence of Yersinia pestis, the causative agent of plague.
Arthite: Genome sequence of Yersinia pestis, the causative agent of plague.
Arthite: Genome sequence of Yersinia pestis, pmID:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Destinianary
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Destinianary
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Destinianary
Arthite: Genome sequence of Yersinia president of plague.
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis, pmiD:11586360
Arthite: Genome sequence of Yersinia pestis pmiD:11586360

The present sequence represents a Neisseria meningitidis antigenic polypeptide, designated BASB030. It was identified from N. meningitidis serotype B strain ATCC 13090. The nucleocide sequence was first identified in the Incyte Pathoseg database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections, e.g. bacteremia and meningities. The antibodies against the protein can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.

It was identified from N. meningitidis serotype B strain ATCC 13090. The nucleotide sequence was first identified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections, e.g. bacteremia and meningitis. The antibodies against the protein can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel gram-negative bacterial bleb presenting on its surface PorB outer membrane protein from Chlamydia trachomatis or protective antigen from Chlamydia pneumoniae, useful for preventing Chlamydia infection
                                                                                                                             The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABB81046 represent nucleic acid molecules of the invention.

This polypeptide sequence has homology to Pseudomonas aeruginosa, Pl1Q fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otttis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polymucleotide sequence can be the response of an infections scraping of disease and for determining the response of an infections organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying
                             The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present amino acid sequence represents a Neisseria gonorrhoeae protein as described in the invention.
                                                                                                                                                                                                                         1 MYTKLIKIISGLFVATAAFQTASAGNITDIKVSSLPNKQKIVKVSFDKEIVNPTGFVTSS 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the BASB031 protein sequence-2, from strain Mc2931(ATCC 43617), derived from Moraxella catarrhalis. This polypeptide sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polynucleotide sequence can be used for diagnosting infections, staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BASB031; strain Mc2931; ATCC 43617; PilO fimbrial assembly protein; diagnosis; treatment; otitis media; sinusitis; pneumonia; screening; homology; nosocomial infection; antibody; ortholog; hybridisation probe.

The present sequence is the BASB031 polypeptide, from strain MC2969, derived from Moraxella catarrhalis. This sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, preumonia, sinustits and nosocoamial infections. The antibodies and polynucleotide sequence can be used for diagnosing infections, staging of disease and for determining the response of an infections organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                          Novel polypeptides used as vaccines for treating Maraxella catarrhalis infections like otitis media and pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Moraxella; vaccine; respiratory tract infection; antiinflammatory; auditory; antibacterial; otitis media; sinusitis; pneumonia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the BASB031 polypeptide, from strain Mc2911, derived from Moraxella catarrhalis. This sequence has homology to Pseudomonas aeruginosa, PilO fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, pneumonia, sinusitis and nosocomial infections, infections, and polynucleotide sequence can be used for diagnosing infections, staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polypeptides used as vaccines for treating Maraxella catarrhalis infections like otitis media and pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BASB031; strain Mc2969; PilQ fimbrial assembly protein; homology; diagnosis; treatment; otitis media; pneumonia; sinusitis; antibody; nosocomial infection; screening; hybridisation probe; ortholog.
                                                                                                                                                                   BASB031; strain Mc2911; PilQ fimbrial assembly protein; homology; diagnosis; treatment; otitis media; pneumonia; sinusitis; antibody; nosocomial infection; screening; hybridisation probe; ortholog.
                                                                                                                            Moraxella catarrhalis BASB031 protein sequence from strain Mc2911.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Moraxella catarrhalis BASB031 protein sequence from strain Mc2969
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target viruleance factors directly at host cells. The present sequence is the BscC protein of B. pertussis. The present protein is encoded by a Class I type gene and is involved in partection system of B. pertussis i.e. a Bordetella pathogenicity protein. The gene of the present protein is located within a pathogenicity island (see AAA64890). A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The present protein may be used to treat or diagnose B. pertussis infection, e.g. as a vaccine. Whooping cough is a disease caused by infection by B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can cause otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.

the expression of a lipase; (c) a Pseudomonas alcaligenes upstream activating sequence; (d) a P. alcaligenes sigma 54 promoter that regulates the expression of a lipase; (e) a P. alcaligenes secretion factor selected from XcpP, Q, R, S, T, U, V, W, X, Y and Z, and OrfV, X, Y, (f) a P. alcaligenes lux-box binding element; and (g) a orfV-box binding element. The nucleic acids represent parts of a regulation cascade, comprising at the heart a kinase and a DNA binding requlator. These sequences can be used for the production of heterologous proteins in a host cell. The cascade also comprises secretion factors which can enhance the secretion of produced proteins. The present invention describes an expression vector comprising a nucleic acid encoding a kinase and a DNA binding regulator which hybridises under stringent conditions to a nucleic acid isolated from preudomonas alcaligenes. Also described are: (1) an isolated plasmid comprising the above expression vector; (2) a method of transforming a host cell comprising adding the above plasmid to host cells under appropriate conditions; (3) a transformed host cell comprising the above expression vector; and (4) a method for producing a protein comprising the steps of obtaining a host cell comprising the steps of obtaining a host cell comprising the above expression vector and further comprising nucleic acid encoding the protein, and culturing the host cell under conditions for the expression of protein. The expression vector of the present invention Expression vector for producing heterologous proteins in host cells comprises a nucleic acid encoding a kinase and a DNA binding regulator which hybridizes under stringent conditions to nucleic acid Pseudomonas alcaligenes; expression, lipase regulation cascade, kinase, DNA binding regulator; polymerase; promoter; secretion factor; XcpP, XcpQ, XcpP, XcpQ, XcpV, XcpX, XcpX, XcpY, XcpV, OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; of formulation. The secretion factor is encoded by an open reading frame identified in a cosmid (see AAF30870) derived from P. alcaligenes DNA. Secretion factors aid the secretion of other proteins from a cell. A new expression system comprises components of a lipase regulation cascade including a kinase, DNA binding regulator, polymerase, a promoter, an upstream activating sequence, and secretion factors. The secretion factor is preferably sequence, and secretion factors. The secretion factor is preferably concert with other members of the Xcp family. Plasmids and concert with other members of the Xcp family. Plasmids and concert with other members of the Xcp family. Plasmids and concert with other members of the ABB2156.68) and acts in comprise a nucleic acid encoding a desired protein, especially an esterase, hydrolase, lipase, isomerase, mutase, transferase, kinase or phosphatase (claimed). A hyper-producing strain can be
can be used for producing heterologous proteins in host cells, particularly, lipase in Pseudomonas. Lipases produced can be used in detergents and cleaning formulations in industrial processes. These invention provides a higher production level and efficiently express a heterologous protein. The present sequence represents XCPQ isolated from Pseudomonas alcaligenes, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated nucleic acid encoding kinase from Pseudomonas that can regulate expression of lipase, useful in expression systems for production of lipase which is useful in detergents and cleaning formulations
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB; AAF30870.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a polynucleotide encoding a DNA binding regulator that can regulate the expression of a lipase. The invention also relates to an expression system computing components of Pseudomonas alcalignes lipas regulation cascade which includes kinases, DNA binding regulators, polymerases, promoters, upstream activating factors and secretion factors. DNA binding regulators of the invention are useful for regulating the expression of a lipase, where the lipase is useful in detergents and other cleaning formulations as well as a number of industrial processes. Various components of lipase regulation cascade is useful in expression methods and systems designed for the production of heterologous proteins. The present sequence is P. alcaligenes XCPQ, a secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Beadomonas aeruginosa and Enterococcus faceralis. The Ci vantibiotic development. The antisense nucleic acids can also be used invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.
